

python split

```
import re

def split_class_name(class_name):
    sub = re.sub('([A-Z][^A-Z]*)', r' \1', class_name)
    splitted = re.split(r'[\s\-\_]', sub)

    splitted = list(map(lambda x: x.lower().strip(), splitted))
    splitted = list(filter(lambda x: x != '', splitted))

    return ' '.join(splitted)
name = 'amaCamelCase__Test123-dash'
result = split_class_name(name)

['ama', 'camel', 'case', 'test123', 'dash']
```
