

# vercel ignore

[vercel](#), [ignore](#), [build](#), [step](#)

: project ⇒ setting ⇒ git ⇒ [Ignored Build Step](#)

vercel env 가

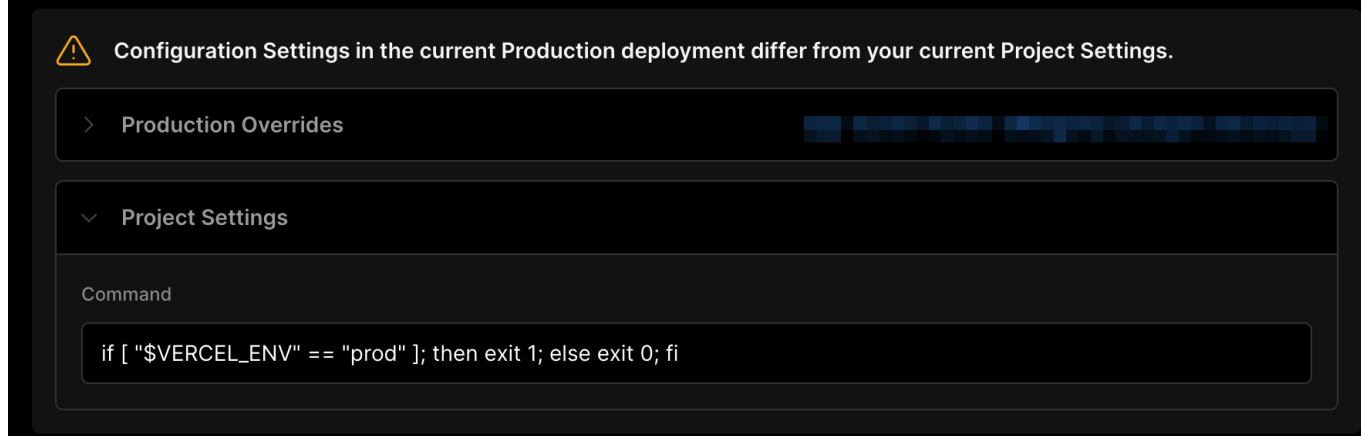

```
"if [ "$VERCEL_ENV" == "prod" ]; then exit 1; else exit 0; fi"
```

## Ignored Build Step

When a commit is pushed to the Git repository that is connected with your Project, its SHA will determine if a new Build has to be issued. If the SHA was deployed before, no new Build will be issued.

You can customize this behavior with a command that exits with code 1 (new Build needed) or code 0.
