

VIPER

- **VIEW**
 - The View is the user interface. It's responsible for displaying things as directed by presenter and sends the actions taken by the user to the presenter
- **Interactor**
 - The Interactor is responsible for interacting between the presenter(business logic layer) and the data(domain layer)
- **Presenter**
 - This is our Business logic layer. Directing data between UI layer and Interactor Layer and taking user actions and calling to the router to move the user between views.
- **Entity**
 - It's the information and data used on the functionality. In our case, it will be CoreData since our information will be stored there.
- **Router**
 - It stores the navigation logic used for describing which screens need to be displayed.
