

protocol

A [protocol](#) defines a set of method signatures. Every Clojure method implements a protocol signature

- [deftype](#) (mutable fields)
- [defrecord](#) (immutable fields, map interface)
- [extend-type](#)

```
; general form  
(defprotocol name docstring method-signatures)  
  
; general form of a method signature  
(method-name parameter-lists method-docstring)
```
