

Webhook payload object common properties

Each Webhook event payload also contains properties unique to the event. You can find the unique properties in the individual event type sections.

Key	Type	Description
action	string	Most webhook payloads contain an action property that contains the specific activity that triggered the event
sender	object	The user that triggered the event. This property is included in every webhook payload
repository	object	The repository where the event occurred. Webhook payloads contain the repository property when the event occurs from activity in a repository.
organization	object	Webhook payloads contain the organization object when the webhook is configured for an organization or the event occurs from activity in a repository owned by an organization
installation	object	The GitHub App installation. Webhook payloads contain the installation property when the event is configured for and sent to a GitHub App. For more information, see “ Building GitHub App ”
